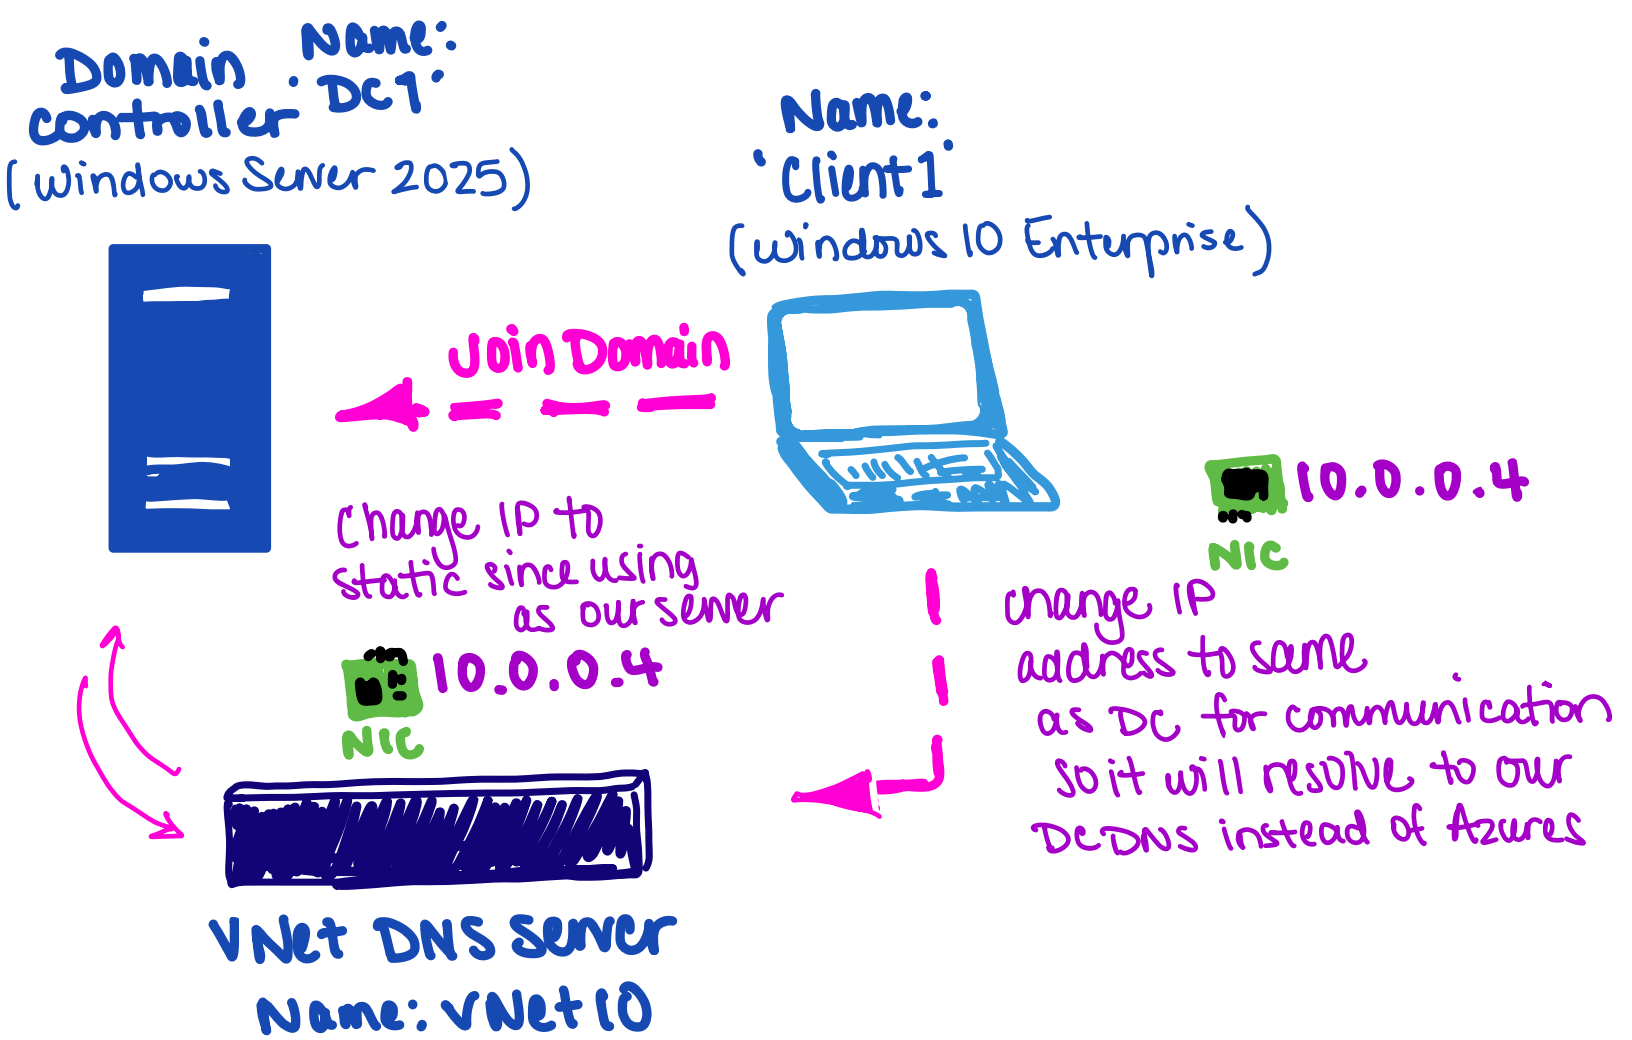
Build + Deploy Infrastructure for AD

My Virtual Network

Resource Group Name: TensLab
VNet Name: VNet10



① Create a Resource Group first b/c Azure requires a container to hold all related resources together. Its like the project main folder

② Create a VNet because DC needs a private network where other machines can communicate with it.

③ Create 1st vm using Image Windows Server 2025 - <u>Domain Controller</u>

④ Set DC NIC Private IP address to Static

⑤ Create 2nd vm using Image Windows 10 Enterprise - <u>user - Client 1</u>

⑥ Log into vm and disable Windows Firewall
Run "wf.msc"

⑦ Change DNS server IP address on Client 1 to match IP of DC

⑧ Log in to Client 1 and ping DC1 to confirm connectivity (Powershell)
"ping 10.0.0.4"

⑨ In Powershell command "ipconfig /all" to observe dns settings, should show DC1 private IP address 10.0.0.4
